

## Homework - CS 2020 Problem Sheet #5

### Problem 5.1

We plan to use a fixed size b-complement number system with the base  $b = 5$  and  $n = 4$  digits.

a) What are the smallest and the largest number that can be represented and why?

- largest number =  $4444_5$  to base 10  $\rightarrow 624_{10}$

- smallest number =  $0000_5$  to base 10  $\rightarrow 0_{10}$

b) What is the representation of  $-1$  and  $-8$  in b-complement notation?

-  $|(-1)_{10}| = |(1)_{10}| = 0001_5 \quad |(-8)_{10}| = |(8)_{10}| = 0013_5$

$1 = 0 * 5 + 1$	$1$	$8 = 1 * 5 + 3$	$3$
$0 = 0 * 5 + 0$	$01$	$1 = 0 * 5 + 1$	$13$
$0 = 0 * 5 + 0$	$001$	$0 = 0 * 5 + 0$	$013$
$0 = 0 * 5 + 0$	$0001$	$0 = 0 * 5 + 0$	$0013$

Find the complement of our numbers in base b using  $a'_i = (b-1) - a_i$ :

0001:  $a_4 = 0 \rightarrow a'_4 = (5-1) - 0 = 4$   
 $a_3 = 0 \rightarrow a'_3 = (5-1) - 0 = 4$   
 $a_2 = 0 \rightarrow a'_2 = (5-1) - 0 = 4$   
 $a_1 = 1 \rightarrow a'_1 = (5-1) - 1 = 3 \quad 4443_5$

0013:  $a_4 = 0 \rightarrow a'_4 = (5-1) - 0 = 4$   
 $a_3 = 0 \rightarrow a'_3 = (5-1) - 0 = 4$   
 $a_2 = 1 \rightarrow a'_2 = (5-1) - 1 = 3$   
 $a_1 = 3 \rightarrow a'_1 = (5-1) - 3 = 1 \quad 4431_5$

Add 1 to  $-1$  &  $-8$  representation in this base as the last step:

$4443_5 + 1_5 = 4444_5$ <div style="text-align: right; margin-right: 20px;"><math>4443</math> <math>+ \quad 0001</math> <math>\text{-----}</math> <math>4444</math></div>	$4431_5 + 1_5 = 4432_5$ <div style="text-align: right; margin-right: 20px;"><math>4431</math> <math>+ \quad 0001</math> <math>\text{-----}</math> <math>4432</math></div>
--	--

So, b-complement notation of  $-1$  and  $-8$  in base 5 with 4-digit representation are respectively  $4444_5$  and  $4432_5$ .

- c) Add the numbers  $-1$  and  $-8$  in b-complement notation. What is the result in b-complement representation? What is the result converted back into the decimal number system?

- Addition in b-complement notation of  $-1$  and  $-8$ :

```

      4444
+     4432
-----

```

14431 (We drop the first 1 as it is an overflow //  $n = 4$ )

In order to convert back to decimal, we invert the bits using  $a_i = b - 1 - a'_i$  (the inverse of  $a'_i = (b-1) - a_i$ ), then we add 1 to the result and convert to decimal.

$$4431: a_4 = 4 \rightarrow a_4 = 5 - 1 - 4 = 0$$

$$a_3 = 4 \rightarrow a_3 = 5 - 1 - 4 = 0$$

$$a_2 = 3 \rightarrow a_2 = 5 - 1 - 3 = 1$$

$$a_1 = 1 \rightarrow a_1 = 5 - 1 - 1 = 3 \quad 0013_4$$

$$0013_5 + 1_5 = 0014_5$$

```

      0013
+     0001
-----
      0014

```

$$0014 \rightarrow |1 \times 5 + 4 \times 1| = |9|$$

(value of sum is  $-9$  however, since we took the absolute value of  $-1$  and  $-8$  as well the carry-over overflow)

$$\begin{array}{rcll} 273 & = & 136 * 2 + 1 & 1 \\ 136 & = & 68 * 2 + 0 & 01 \\ 68 & = & 34 * 2 + 0 & 001 \\ 34 & = & 17 * 2 + 0 & 0001 \\ 17 & = & 8 * 2 + 1 & 10001 \\ 8 & = & 4 * 2 + 0 & 010001 \\ 4 & = & 2 * 2 + 0 & 0010001 \\ 2 & = & 1 * 2 + 0 & 00010001 \\ 1 & = & 0 * 2 + 1 & 100010001 \\ 0 & = & 0 * 2 + 0 & \end{array}$$

Converting fraction part:

$$0.15 * 2 = 0.3 \quad 0 \qquad 0.15_{10} = \overline{001001}_2$$

$$0.3 * 2 = 0.6 \quad 0$$

$$0.6 * 2 = 1.2 \quad 1$$

$$0.2 * 2 = 0.4 \quad 0$$

$$0.4 * 2 = 0.8 \quad 0$$

$$0.8 * 2 = 1.6 \quad 1$$

*Keeps repeating*

$$0.6 * 2 = 1.2 \quad 1$$

$$0.2 * 2 = 0.4 \quad 0$$

$$0.4 * 2 = 0.8 \quad 0$$

$$0.8 * 2 = 1.6 \quad 1$$

...

Combine the two parts.  $(100010001.\overline{001001})_2$

Normalize number -> find the exponent:  $(1.\overline{00010001001001})_2 \times 2^8$

Add the exponent bias  $(127)_{10}$  to the exponent  $(8)_{10}$  ->  $127 + 8 = (135)_{10}$

Convert the biased exponent  $(135)_{10}$  to binary.

$$135 = 67 * 2 + 1 \qquad 1 \qquad 135_{10} = 10000111_2$$

$$67 = 33 * 2 + 1 \qquad 1$$

$$33 = 16 * 2 + 1 \qquad 1$$

$$16 = 8 * 2 + 0 \qquad 0$$

$$8 = 4 * 2 + 0 \qquad 0$$

$$4 = 2 * 2 + 0 \qquad 0$$

$$2 = 1 * 2 + 0 \qquad 0$$

$$1 = 0 * 2 + 1 \qquad 1$$

$$0 = 0 * 2 + 0$$

Drop the leading 1 from the binary representation of the number  
 $(1.\overline{00010001001001100110011})_2$ .

So mantissa =  $\overline{00010001001001100110011}$

Single precision floating point number representation of -273.15 is:

$$\begin{array}{c} \underbrace{1}_{\text{S}} \underbrace{10000111}_{\text{exponent}} \underbrace{00010001001001100110011}_{\text{mantissa}} \end{array}$$

b) What is the decimal fraction that is actually stored in the single precision floating point number?

To find out the decimal fraction stored in the single precision floating point number we use the formula that represent the reverse of the above steps:  $(-1)^S \times (1 + m) \times 2^e$

$$S = 1, m = (00010001001001100110011)_2, e = 135-127=8$$

Calculation:

$$(-1)^1 \times (1 + (2^{-4}+2^{-8}+2^{-11}+2^{-14}+2^{-15}+2^{-18}+2^{-19}+2^{-22}+2^{-23})) \times 2^8$$

$$= -273.149994 \rightarrow \text{decimal fraction actually stored in the single precision floating point number}$$

### Problem 5.3

You are given the following UTF-8 sequence in hexadecimal notation (4 bytes):

f0 9f 90 84

Write each byte in binary notation and identify the bits representing the unicode code point.  
What is the Unicode code point (in hexadecimal) and which character does it represent?

UTF-8 hexadecimal to binary

f    0    9    f    9    0    8    4

1111 0000 1001 1111 1001 0000 1000 0100

1111 0xxx 10xx xxxx 10xx xxxx 10xx xxxx

Unicode point in binary

00011111010000000100 =>

0001 1111 0100 0000 0100

1    f    4    0    4    => U + 1f404

The character for the unicode code point is a cow. 🐮
